Tutti i libri del Duca di Riccardo in versione digitale - Spada 7 Milano - Editoria casa pisano. Spedizione con corriere 1 euro. In a wireless communication system, to correctly measure a communication quality such as a signal-to-noise ratio (SNR), it is important to know a channel state between a transmitter and a receiver. However, when using a single antenna, a channel state between a transmitter and a receiver cannot be known unless the transmitter and the receiver communicate with each other. In a communication system using a single antenna, it is important to know the channel state between the transmitter and the receiver. In a communication system using a single antenna, to correctly measure a communication quality such as a signal-to-noise ratio (SNR), it is important to know a channel state between a transmitter and a receiver. However, when using a single antenna, a channel state between a transmitter and a receiver cannot be known unless the transmitter and the receiver communicate with each other. FIG. 1 shows an example of a system for measuring a channel state between a transmitter and a receiver in the prior art. In the example shown in FIG. 1, both a transmitter 101 and a receiver 102 include a single antenna. As a result, a signal transmitted from the transmitter 101 and a signal received by the receiver 102 are interfered with each other. In this way, a channel state between a transmitter and a receiver cannot be measured unless the transmitter and the receiver communicate with each other. It is important to know a channel state between a transmitter and a receiver to correctly measure a communication quality such as a signal-to-noise ratio (SNR). In a communication system using a single antenna, it is important to know the channel state between the transmitter and the receiver.
