In Photoshop, you might be asked to choose a selection area that represents the final image. If you just select an area in an image and drag, it simply moves the image - but the image is only changing its x-position. If you choose to use shape tools, the selection acts like a shape that's moving around in space, while maintaining its size, shape and position relative to other content within the image. The main problem with the traditional tools is that they only allow you to edit the raster, meaning the image is turning into a pixelated mess when selected. With the Sherpa lines, you can still achieve this but by ensuring you have the texture selected before starting the cutting process. This is very helpful if you are using brushes that affect the way the images look, and you can also use the shape tools to achieve this. You will notice that when you use the Clip Studio Paint brush, you get a very different result than using just the round sash shapes. I just went though and bought a bunch of brushes from Clopaint . They have brushes free, as well as different brush sets that will help you perfect your style whether you're working digitally or on canvas. Paint has new features focusing on creating brush collections. You can now save your recent brushes to a new BrushCast collection, and even share to social media with the "Share Brushcast" option. It also has a new "Master Brushes" feature which lets you edit the look of all the brushes in a collection with one click. And of course, you also now have access to multiple user preferred brushes with the "Signature Strokes" feature.

How does this affect the open source community? The open source community has done a great job supporting Adobe's latest products over the last decade. The open source community has helped Adobe build some of their most trusted brands and has offered its communities software enhancement funds to smooth the adoption path to more products. It is only fair that Adobe wants to reciprocate in that help but they also need to ensure that the open source community has a clear path to code based on industry standards. The open source world will have to lean on its various

communities (graphics, design and content creation) to feed its electricity source. The likes of Blender and Final Cut Pro will need to embrace new features, learn them and evolve from within and these are always high-risk, high-reward endeavours. It's unlikely that we'll ever see a monopoly on the GPU side, but it's not too far-fetched to imagine the rise of the Substance platform as the silos of expertise grow ever bigger. With Adobe gaining more programming talent as it's ecosystem grows - both in the commercial and open source aspects - it will also be interesting to see how this transition affects the creation of new features across their toolsets. Unity could (and should) look to asset store economies to underpin its Creative Cloud offering - but how much is (and should be) accessible? Owning assets and connections is a great thing; but what happens to content and creation when a shift in power tears down the ownership connections that exist today? With the rise of the creative community, new licensing models and the democratisation of behind the scenes asset investment, there is an opportunity to build a new, more democratic marketplace model. The era of the 'traditional' open source model will be increasingly supplemented by curation-based models and engagement-style consumption models that incentivise asset investment.

Firstly, there has been a Lead tool used almost everywhere in Photoshop. It's called the Viewer tool. It can be selected by clicking on it in the view of the 3D workspace or from the Window menu. With the New 2019 version of Photoshop, the **Layout Tool** has been introduced as one of the best tools in designing web pages or other websites. It is not only easy to use but is a perfect choice to design a web page in terms of mobile and desktop devices. In fact, with the released version, the buttons are also visible and within reach in the interface. The latest version of Photoshop is based on the same name of Graphical user interface (GUI). While working on the workspace, one may observe a lot of changes in the interface and of course, all the possible we have mentioned in the last episode. Its **Release tag** is the latest update and can be found next to the camera icon on the bottom of the workspace. It can be used to control the size of the startup image when starting Photoshop. If you wish to have more tabs, you can **click on the left-most tab** and then **select More tabs** and finally **click on the desired tab**. The new version of the **Auto-Align** tool can be found under the Anchor border in the panel. It allows users to specify the margin of the selected object, if the object is shifted by more than one pixel. We tested this feature and it only works in 'Bring to Front' mode, which is very useful.
